An environment for multicolumn output

Frank Mittelbach
Email: see top of the source file

Printed January 24, 2000

Abstract
This article describes the use and the implementation of the \texttt{multicols} environment. This environment allows switching between one and multicolumn format on the same page. Footnotes are handled correctly (for the most part), but will be placed at the bottom of the page and not under each column. \TeX{}’s float mechanism, however, is partly disabled in the current implementation. At the moment only page-wide floats (i.e., star-forms) can be used within the scope of the environment.

Preface to version 1.5
This new release contains two major changes: \texttt{multicols} will now support up to 10 columns and two more tuning possibilities have been added to the balancing routine. The balancing routine now checks the badness of the resulting columns and rejects solutions that are larger than a certain threshold.

At the same time \texttt{multicols} has been upgraded to run under \LaTeX{} 2\epsilon. I apologise for the state of the code documentation but the work on \LaTeX{} 2\epsilon kept me too busy to do a proper job. This will hopefully be corrected in the near future.

1 Introduction
Switching between two column and one column layout is possible in \LaTeX{}, but every use of \texttt{\twocolumn} or \texttt{\onecolumn} starts a new page. Moreover, the last page of two column output isn’t balanced and this often results in an empty, or nearly empty, right column. When I started to write macros for \texttt{doc.sty} (see “The doc–Option”, \textit{TUGboat} volume 10 \#2, pp. 245-273) I thought that it would be nice to place the index on the same page as the bibliography. And balancing the last page would not only look better, it also would save space; provided of course that it is also possible to start the next article on the same page. Rewriting the index environment was comparatively easy, but the next goal, designing an environment which takes care of footnotes, floats etc., was a harder task. It took me a whole weekend\footnote{I started with the algorithm given in the \TeX{}book on page 417. Without this help a weekend would not have been enough.} to get together the few lines of code below and there is still a good chance that I missed something after all.

Try it and, hopefully, enjoy it; and \textit{please} direct bug reports and suggestions back to Mainz.
2 The User Interface

To use the environment one simply says
\begin{multicols}{⟨number⟩}
⟨multicolumn text⟩
\end{multicols}
where ⟨number⟩ is the required number of columns and ⟨multicolumn text⟩ may contain arbitrary \LaTeX\ commands, except that floats and marginpars are not allowed in the current implementation\textsuperscript{2}.

As its first action, the \texttt{multicols} environment measures the current page to determine whether there is enough room for some portion of multicolumn output. This is controlled by the \texttt{<dimen>} variable \texttt{premulticols} which can be changed by the user with ordinary \LaTeX\ commands. If the space is less than \texttt{premulticols}, a new page is started. Otherwise, a \texttt{vskip} of \texttt{multicolsep} is added.\textsuperscript{3}

When the end of the \texttt{multicols} environment is encountered, an analogous mechanism is employed, but now we test whether there is a space larger than \texttt{postmulticols} available. Again we add \texttt{umulticolsep} or start a new page.

It is often convenient to spread some text over all columns, just before the multicolumn output, without any page break in between. To achieve this the \texttt{multicol} environment has an optional second argument which can be used for this purpose. For example, the text you are now reading was started with
\begin{multicols}{3}
[<section>The User Interface]] ...
\end{multicols}
If such text is unusually long (or short) the value of \texttt{premulticols} might need adjusting to prevent a bad page break. We therefore provide a third argument which can be used to overwrite the default value of \texttt{premulticols} just for this occasion. So if you want to combine some longer single column text with a multicols environment you could write
\begin{multicols}{3}
[<section{Index}]
This index contains ...
[6cm]
...
\end{multicols}

The space between columns is controlled by the length parameter \texttt{columnsep}. The width for the individual columns is automatically calculated from this parameter and the current \texttt{linewidth}. In this article a value of 18.0pt was used.

Separation of columns with vertical rules is achieved by setting the parameter \texttt{columnseprule} to some positive value. In this article a value of .4pt was used.

Since narrow columns tend to need adjustments in interline spacing we also provide a \texttt{<skip>} parameter called \texttt{multicolbaselineskip} which is added to the \texttt{baselineskip} parameter inside the \texttt{multicols} environment. Please use this parameter with care or leave it alone; it is intended only for package file designers since even small changes might produce totally unexpected changes to your document.

2.1 Balancing columns

Besides the previously mentioned parameters, some others are provided to influence the layout of the columns generated.

Paragraphing in \TeX\ is controlled by several parameters. One of the most important is called \texttt{tolerance}: this controls the allowed ‘looseness’ (i.e. the amount of blank space between words). Its default value is 200 (the \LaTeX\ \texttt{fussy} environment) which is too small for narrow columns. On the other hand the \texttt{sloppy} declaration (which sets \texttt{tolerance} to 10000 = \texttt{∞}) is too large, allowing really bad spacing.\textsuperscript{4}

We therefore use a \texttt{multicoltolerance} parameter for the \texttt{tolerance} value inside the \texttt{multicols} environment. Its default value is 9999 which is less than infinity but ‘bad’ enough for most paragraphs in a multicolumn environment. Changing its value should be done outside the \texttt{multicols} environment. Since \texttt{tolerance} is set to \texttt{multicoltolerance} at the beginning of every \texttt{multicols} environment one can locally overwrite this default by assigning \texttt{tolerance = ⟨desired value⟩}. There also exists a \texttt{multicolpretolerance} parameter holding the value for \texttt{pretolerance} within a \texttt{multicols} environment. Both parameters are usually used only by package designers.

Generation of multicolumn output can be divided into two parts. In the first part we are collecting material for a page, shipping it out, collecting material for the next page, and so on.

As a second step, balancing will

\footnotesize
\textsuperscript{2}This is dictated by lack of time. To implement floats one has to reimplement the whole \LaTeX\ output routine.

\textsuperscript{3}Actually the added space may be less because we use \texttt{addvspace} (see the \LaTeX\ manual for further information about this command).

\textsuperscript{4}Look at the next paragraph, it was set with the \texttt{sloppy} declaration.
be done when the end of the multicol s environment is reached. In the first step TEX might consider more material whilst finding the final columns than it actually use when shipping out the page. This might cause a problem if a footnote is encountered in the part of the input considered, but not used, on the current page. In this case the footnote might show up on the current page, while the footnotemark corresponding to this footnote might be set on the next one.\footnote{The reason behind this behavior is the asynchronous character of the \TeX page builder. However, this could be avoided by defining very complicated output routines which don’t use \TeX primitives like \texttt{\textbackslash insert} but do everything by hand. This is clearly beyond the scope of a weekend problem.} Therefore the multicol s environment gives a warning message\footnote{This message will be generated even if there are no footnotes in this part of the text.} whenever it is unable to use all the material considered so far.

If you don’t use footnotes too often the chances of something actually going wrong are very slim, but if this happens you can help \TeX by using a \texttt{\textbackslash pagebreak} command in the final document. Another way to influence the behavior of \TeX in this respect is given by the counter variable ‘collectmore’. If you use the \texttt{\textbackslash setcounter} declaration to set this counter to \langle\texttt{number}\rangle, \TeX will consider \langle\texttt{number}\rangle more (or less) lines before making its final decision. So a value of $-1$ may solve all your problems at the cost of slightly less optimal columns.

In the second step (balancing columns) we have other bells and whistles. First of all you can say \texttt{\textbackslash raggedcolumns} if you don’t want the bottom lines to be aligned. The default is \texttt{\textbackslash flushcolumns}, so \TeX will normally try to make both the top and bottom baselines of all columns align.

Additionally you can set another counter, the ‘unbalance’ counter, to some positive \langle\texttt{number}\rangle. This will make all but the right-most column \langle\texttt{number}\rangle of lines longer than they would normally have been. ‘Lines’ in this context refer to normal text lines (i.e. one \texttt{\textbackslash baselineskip} apart); thus, if your columns contain displays, for example, you may need a higher \langle\texttt{number}\rangle to shift something from one column into another.

Unlike ‘collectmore,’ the ‘unbalance’ counter is reset to zero at the end of the environment so it only applies to one \multicol s environment.

The two methods may be combined but I suggest using these features only when fine tuning important publications.

Two more general tuning possibilities were added with version 1.5. \TeX allows to measure the badness of a column in terms of an integer value, where 0 means optimal and any higher value means a certain amount of extra white space. 10000 is considered to be infinitely bad (\TeX does not distinguish any further). In addition the special value 100000 means overfull (i.e., the column contains more text than could possibly fit into it).

The new release now measures every generated column and ignores solutions where at least one column has a badness being larger than the value of the counter \texttt{\textbackslash columnbadness}. The default value for this counter is 10000, thus \TeX will accept all solutions except those being overfull. By setting the counter to a smaller value you can force the algorithm to search for solutions that do not have columns with a lot of white space.

However, if the setting is too low, the algorithm may not find any acceptable solution at all and will then finally choose the extreme solution of placing all text into the first column.

Often, when columns are balanced, it is impossible to find a solution that distributes the text evenly over all columns. If that is the case the last column usually has less text than the others. In the earlier releases this text was stretched to produce a column with the same height as all others, sometimes resulting in really ugly looking columns.

In the new release this stretching is only done if the badness of the final column is not larger than the value of the counter \texttt{\textbackslash finalcolumnbadness}. The default setting is 9999, thus preventing the stretching for all columns that \TeX would consider infinitely bad. In that case the final column is allowed to run short which gives a much better result. And there are two more parameters of some experimental nature, one called \texttt{\textbackslash multicolovershoot} the other \texttt{\textbackslash multicoulundershoot}. They control the amount of space a column is allowed to be “too full” or “too short” without affecting the column badness. They are set to 2pt by default.

2.2 Not balancing the columns

Although this package was written to solve the problem of balancing columns, I got repeated requests to provide a version where all white space is automatically placed in the last column or columns. Since version
2.3 Manually breaking columns

Another request often voiced was: “How to I tell \TeX that it should break the first column after this particular line?”. The \pagebreak command (which works with the two-column option of \LaTeXX) is of no use here since it would end the collection phase of multicols and thus all columns on that page. So with version 1.5u the \columnbreak command was added. If used within a paragraph it marks the end of the current line as the desired breakpoint. You can observe its effect on the previous page where three lines of text have been artificially forced into the second column (resulting in some white space between paragraphs in the first column).

2.4 Floats inside a multicols environment

Within the multicols environment the usual star float commands are available but their function is somewhat different as in the two-column mode of standard \LaTeXX. Stared floats, e.g., \figure*, denote page wide floats that are handled in a similar fashion as normal floats outside the multicols environment. However, they will never show up on the page where they are encountered. In other words, one can influence their placement by specifying a combination of t, b, and/or p in their optional argument, but h doesn’t work because the first possible place is the top of the next page. One should also note, that this means that their placement behavior is determined by the values of topfraction, etc. rather then by \dbl...

2.5 Warnings

Under certain circumstances the use of the multicols environment may result in some warnings from \LaTeXX or \LaTeX. Here is a list of the important ones and the possible cause:

Underfull \hbox (badness ...
As the columns are often very narrow \LaTeX wasn’t able to find a good way to break the paragraph. Underfull denotes a loose line but as long the badness values is below 10000 the result is probably acceptable.

Underfull \vbox ... while \output is active
If a column contains an character with an unusual depth, for example a ‘(', in the bottom line then this message may show up. It usually has no significance as long as the value is not more than a few points.

LaTeX Warning: I moved some lines to the next page
As mentioned above, multicols sometimes screws up the footnote numbering. As a precaution, whenever there is a footnote on a page where multicols had to leave a remainder for the following page this warning appears. Check the footnote numbering on this page. If it turns out that it is wrong you have to manually break the page using \newpage or \pagebreak[...].

Floats and marginpars not allowed inside ‘multicols’ environment!

This message appears if you try to use the \marginpar command or an unstared version of the figure or table environment. Such floats will disappear!

2.6 Tracing the output

To understand the reasoning behind the decisions \LaTeX makes when processing a multicols environment, a tracing mechanism is provided. If you set the counter \multicols to a positive \langle number\rangle you then will get some tracing information on the terminal and in the transcript file:

\langle number\rangle = 1. \LaTeX will now tell you, whenever it enters or leaves a multicols environment, the number of columns it is working on and its decision about starting a new page before or after the environment.

\langle number\rangle = 2. In this case you also get information from the balancing routine: the heights tried for the left and right-most columns, information about shrinking if the \raggedcolumns declaration is in force and the value of the ‘unbalance’ counter if positive.

\langle number\rangle = 3. Setting \langle number\rangle to this value will additionally trace the mark handling algorithm. It will show what marks are found, what marks are considered, etc. To fully understand this information you will probably have to read carefully trough the implementation.

\langle number\rangle ≥ 4. Setting \langle number\rangle to such a high value
will additionally place an \hrule into your output, separating the part of text which had already been considered on the previous page from the rest. Clearly this setting should not be used for the final output. It will also activate even more debugging code for mark handling.

3 Prefaces to older versions

3.1 Preface to version 1.4

Beside fixing some bugs as mentioned in the multicol.bug file this new release enhances the multicol environment by allowing for balancing in arbitrary contexts. It is now, for example, possible to balance text within a multicol or a minipage as shown in 2 where a multicol environment within a quote environment was used. It is now even possible to nest multicol environments.

The only restriction to such inner multicol environments (nested, or within \TeX’s internal vertical mode) is that such variants will produce a box with the balanced material in it, so that they can not be broken across pages or columns.

Additionally I rewrote the algorithm for balancing so that it will now produce slightly better results.

I updated the source documentation but like to apologize in advance for some ‘left over’ parts that slipped through the revision.

A note to people who like to improve the balancing algorithm of multicol: The balancing routine in now placed into a single macro which is called \balance@columns. This means that one can easily try different balancing routines by rewriting this macro. The interface for it is explained in table 1. There are several improvements possible, one can think of integrating the \badness function of \TeX3, define a faster algorithm for finding the right column height, etc. If somebody thinks he/she has an enhancement I would be pleased to learn about it. But please obey the copyright notice and don’t change multicol.dtx directly!

3.2 Preface to version 1.2

After the article about the multicol environment was published in TUGboat 10#3, I got numerous requests for these macros. However, I also got a changed version of my style file, together with a letter asking me if I would include the changes to get better paragraphing results in the case of narrow lines. The main differences to my original style option were additional parameters (like \multicoladjdemerits to be used for \adjdemerits, etc.) which would influence the line breaking algorithm.

But actually resetting such parameters to zero or even worse to a negative value won’t give better line breaks inside the multicol environment. \TeX’s line breaking algorithm will only look at those possible line breaks which can be reached without a badness higher than the current value of \tolerance (or \pretolerance in the first pass). If this isn’t possible, then, as a last resort, \TeX will produce overfull boxes. All those (and only those) possible break points will be considered and finally the sequence which results in the fewest demerits will be chosen. This means that a value of −1000 for \adjdemerits instructs \TeX to prefer visibly incompatible lines instead of producing better line breaks.

However, with \TeX 3.0 it is possible to get decent line breaks even in small columns by setting \emergencystretch to an appropriate value. I implemented a version which is capable of running both in the old and the new \TeX (actually it will simply ignore the new feature if it is not available). The calculation of \emergencystretch is probably incorrect. I made a few tests but of course one has have much more experience with the new possibilities to achieve the maximum quality.

Version 1.1a had a nice ‘feature’: the penalty for using the forbidden floats was their ultimate removal from \@freelist so that after a few \marginpars inside the multicol environment floats where disabled forever. (Thanks to Chris Rowley for pointing this out.) I removed this misbehaviour and at the same time decided to allow at least floats spanning all columns, e.g., generated by the figure* environment. You can see the new functionality in table 2 which was inserted at this very point. However single column floats are still forbidden and I don’t think I will have time to tackle this problem in the near future. As an advice for all who
The macro \balance@columns that contains the code for balancing gathered material is a macro without parameters. It assumes that the material for balancing is stored in the box \mult@box which is a \vbox. It also “knows” about all parameters set up by the multicols environment, like \col@number, etc. It can also assume that \@colroom is the still available space on the current page.

When it finishes it must return the individual columns in boxes suitable for further processing with \page@sofar. This means that the left column should be stored in box register \mult@gfirstbox, the next in register \mult@firstbox + 2, ..., only the last one as an exception in register \mult@grightbox. Furthermore it has to set up two the macros \kept@firstmark and \kept@botmark to hold the values for the first and bottom mark as found in the individual columns. There are some helper functions defined in section 5.1 which may be used for this. Getting the marks right “by hand” is non-trivial and it may pay off to first take a look at the documentation and implementation of \balance@columns below before trying anew.

Table 1: Interface description for \balance@columns

| \setemergencystretch: This is a hook for people who like to play around. It is supposed to set the \emergencystretch \langle \text{dimen} \rangle register provided in the new \TeX{} 3.0. The first argument is the number of columns and the second one is the current \hsize. At the moment the default definition is 4pt × #1, i.e. the \hsize isn’t used at all. But maybe there are better formulae. | \set@floatcmds: This is the hook for the experts who like to implement a full float mechanism for the \multicols environment. The @ in the name should signal that this might not be easy. |

Table 2: The new commands of multicol.sty version 1.2. Both commands might be removed if good solutions to these open problems are found. I hope that these commands will prevent that nearly identical style files derived from this one are floating around.

| \setemergencystretch: This is a hook for people who like to play around. It is supposed to set the \emergencystretch \langle \text{dimen} \rangle register provided in the new \TeX{} 3.0. The first argument is the number of columns and the second one is the current \hsize. At the moment the default definition is 4pt × #1, i.e. the \hsize isn’t used at all. want to try: wait for \TeX{} 3.0. It has a few features which will make life much easier in multi-column surroundings. Nevertheless we are working here at the edge of \TeX{}s capabilities, really perfect solutions would need a different approach than it was done in \TeX{}s page builder.

The text below is nearly unchanged, I only added documentation at places where new code was added.

4 The Implementation

We are now switching to two-column output to show the abilities of this environment (and bad layout decisions).

4.1 The documentation driver file

The next bit of code contains the documentation driver file for \TeX{}, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the \docstrip program. Since this is the first code in this file one can produce the documentation simply by running \E\TeX{} on the .dtx file.

```
1 \langle*driver
2 \documentclass{ltxdoc}
```

We use the \balancingshow option when loading \multicols so that full tracing is produced. This has to be done before the \doc package is loaded, since \doc otherwise requires \multicols without any options.

```
3 \usepackage{multicol}[1999/05/25]
4 \usepackage{doc}
```

First we set up the page layout suitable for this article.

```
5 \setlength{\textwidth}{39pc}
6 \setlength{\textheight}{54pc}
7 \setlength{\parindent}{1em}
8 \setlength{\parskip}{0pt plus 1pt}
9 \setlength{\oddsidemargin}{0pc}
```
4.2 Identification and option processing

We start by identifying the package. Since it makes use of features only available in \LaTeXe we ensure that this format is available. (Now this is done earlier in the file.)

Next we declare options supported by \texttt{multicols}. Two column mode and \texttt{multicols} do not work together so we warn about possible problems. However, since you can revert to \texttt{\onecolumn} in which \texttt{multicols} does work, we don’t make this an error.

4.3 Starting and Ending the \texttt{multicols} Environment

As mentioned before, the \texttt{multicols} environment has one mandatory argument (the number of columns) and up to two optional ones. We start by reading the number of columns into the \texttt{\col@number} register.

If the user forgot the argument, \TeX will complain about a missing number at this point. The error recovery mechanism will then use zero, which isn’t a good choice in this case. So we should now test whether everything is okay. The minimum is two columns at the moment.

We have only enough box registers for ten columns, so we need to check that the user hasn’t asked for more.

Line numbers are very small for this article.
Within the environment we need a special version of the kernel `\@footnotetext` command since the original sets the `\hsize` to `\columnwidth` which is not correct in the multicols environment. Here `\columnwidth` refers to the width of the individual column and the footnote should be in `\textwidth`. Since `\@footnotetext` has a different definition inside a minipage environment we do not redefine it directly. Instead we locally set `\columnwidth` to `\textwidth` and call the original (current) definition stored in `\orig@footnotetext`.

\let\orig@footnotetext\@footnotetext
\long\def\@footnotetext##1\begingroup{\columnwidth\textwidth\orig@footnotetext{##1}\endgroup}

Now we can safely look for the optional arguments.

\ifnextchar[\mult@cols\mult@cols[{}]

The `\mult@cols` macro grabs the first optional argument (if any) and looks for the second one.

\def\mult@cols[#1]{\ifnextchar[}%

This argument should be a ⟨dimen⟩ denoting the minimum free space needed on the current page to start the environment. If the user didn’t supply one, we use `\premulticols` as a default.

\{\mult@cols[#1]}%\{\mult@cols[]\}

After removing all arguments from the input we are able to start with `\mult@cols`.

\def\mult@cols[#1][#2]{%}

First thing we do is to decide whether or not this is an unbounded multicols environment, i.e. one that may split across pages, or one that has to be typeset into a box. If we are in \TeX’s “inner” mode (e.g., inside a box already) then we have a boxed version of multicols therefore we set the `\boxedmulticols` switch to true. The `\multicols` should start in vertical mode. If we are not already there we now force it with `\par` since otherwise the test for “inner” mode wouldn’t show if we are in a box.

\par
\ifinner \boxedmulticolstrue

Otherwise we check `\doublecol@number`. This counter is zero outside a multicols environment but positive inside (this happens a little later on). In the second case we need to process the current multicols also in “boxed mode” and so change the switch accordingly.

\ifnum \doublecol@number>0%
\fi
\if\boxedmulticols\MessageBreak\fi
\fi

Then we look to see if statistics are requested:

\mult@info\z@
{Starting environment with\the\col@number\space columns}%

In boxed mode we add some more info.

\if\boxedmulticols\MessageBreak\fi

Now we can safely look for the optional arguments.

\ifnextchar[\mult@cols\mult@cols[{}]

Then we measure the current page to see whether a useful portion of the multicolumn environment can be typeset. This routine might start a new page.

\enough@room[\#2]%

Now we output the first argument and produce vertical space above the columns. (Note that this argument corresponds to the first optional argument of the `\multicols` environment.) For many releases this argument was typeset in a group to get a similar effect as `\twocolumn[..]` where the argument is also implicitly surrounded by braces. However, this conflicts with local changes done by things like sectioning commands (which account for the majority of commands used in that argument) messing up vertical spacing etc. later in the document so that from version `1.5q` on this argument is again typeset at the outer level.

#1\par\addvspace\multicolsep

We start a new grouping level to hide all subsequent changes (done in `\prepare@multicols` for example).

\begin{group}
\prepare@multicols

If we are in boxed mode we now open a box to typeset all material from the multicols body into it, otherwise we simply go ahead.

\if\boxedmulticols
\setbox\mult@box\vbox\bgroup

We may have to reset some parameters at this point, perhaps `\@parboxrestore` would be the right action but I leave it for the moment.

\fi

We finish by suppressing initial spaces.

\ignorespaces}
Here is the switch and the box for “boxed” multicols code.

\newif\if@boxedmulticols
\@boxedmulticolsfalse
\newbox\mult@box

The \enough@room macro used above isn’t perfect but works reasonably well in this context. We measure the free space on the current page by subtracting \pagetotal from \pagegoal. This isn’t entirely correct since it doesn’t take the ‘shrinking’ (i.e. \pageshrink) into account. The ‘recent contribution list’ might be nonempty so we start with \par and an explicit \penalty. Actually, we use \addpenalty to ensure that a following \addvspace will ‘see’ the vertical space that might be present. The use of \addpenalty will have the effect that all items from the recent contributions will be moved to the main vertical list and the \pagetotal value will be updated correctly. However, the penalty will be placed in front of any dangling glue item with the result that the main vertical list may already be overfull even if \TeX is not invoking the output routine.

\def\enough@room#1{\If@boxedmulticols\else\par\fi}

Measuring makes only sense when we are not in “boxed mode” so the routine does nothing if the switch is true.

\if@boxedmulticols\else\par\fi

To empty the contribution list the first release contained a penalty zero but this had the result that \addvspace couldn’t detect preceding glue. So this was changed to \addpenalty. But this turned out to be not enough as \addpenalty will not add a penalty when @nobreak is true. Therefore we force this switch locally to false. As a result there may be a break between preceding text and the start of a multicols environment, but this seems acceptable since there is the optional argument for exactly this reason.

\bgroup@nobreakfalse\addpenalty\z@egroup
\page@free \pagegoal
\advance \page@free \- \pagetotal

To be able to output the value we need to assign it to a register first since it might be a register (default) in which case we need to use \the or it might be a plain value in which case \the would be wrong.

\@tempskipa#1\relax

Now we test whether tracing information is required:

\mult@info\z@\{Current page:\MessageBreak
\height=\%\the\pagegoal: used \the\pagetotal
\space \- free=\the\page@free
\MessageBreak
needed \the\@tempskipa
\space(for #1)\%

Our last action is to force a page break if there isn’t enough room left.

\ifdim \page@free <#1\newpage \fi

When preparing for multicolumn output several things must be done.

\def\prepare@multicols{\We start saving the current @totalleftmargin and then resetting the \parshape in case we are inside some list environment. The correct indentation for the multicols environment in such a case will be produced by moving the result to the right by \multicol@leftmargin later on. If we would use the value of of \@totalleftmargin directly then lists inside the multicols environment could cause a shift of the output.

\multicol@leftmargin\@totalleftmargin
\@totalleftmargin\z@
\parshape\z@

We also set the register \doublecol@number for later use. This register should contain 2 \times \col@number. This is also an indicator that we are within a multicols environment as mentioned above.

\doublecol@number\col@number
\multiply\doublecol@number\tw@
\advance\doublecol@number\mult@rightbox
\if@boxedmulticols
\let\l@kept@firstmark\kept@firstmark
\let\l@kept@botmark\kept@botmark
\global\let\kept@firstmark\@empty
\global\let\kept@botmark\@empty
\else
\We add an empty box to the main vertical list to ensure that we catch any insertions (held over or inserted at the top of the page). Otherwise it might happen that the \eject is discarded without calling the output routine. Inside the output routine we remove this box again. Again this code applies only if we are on the main vertical list and not within a box. However, it is not enough to turn off interline spacing, we also have to clear \topskip before adding this box, since \topskip is always inserted.

\mult@info\z@\{Current page:\MessageBreak
\height=\%\the\pagegoal: used \the\pagetotal
\space \- free=\the\page@free
\MessageBreak
needed \the\@tempskipa
\space(for #1)\%

Our last action is to force a page break if there isn’t enough room left.

\ifdim \page@free <#1\newpage \fi

When preparing for multicolumn output several things must be done.

\def\prepare@multicols{\We start saving the current @totalleftmargin and then resetting the \parshape in case we are inside some list environment. The correct indentation for the multicols environment in such a case will be produced by moving the result to the right by \multicol@leftmargin later on. If we would use the value of of \@totalleftmargin directly then lists inside the multicols environment could cause a shift of the output.

\multicol@leftmargin\@totalleftmargin
\@totalleftmargin\z@
\parshape\z@

We also set the register \doublecol@number for later use. This register should contain 2 \times \col@number. This is also an indicator that we are within a multicols environment as mentioned above.

before the first box on a page which would leave us
with an extra space of \topskip if \multicols start on
a fresh sheet.

\global\setbox\partial@page\vbox
\fi

Now we have to make sure that we catch one special
situation which may result in loss of text! If
the user has a huge amount of vertical material
within the first optional argument that is larger then
\premulticols and we are not near the bottom of
the page then it can happen that not the \eject is
triggering this special output routine but rather the
overfull main vertical list. In this case we get an
other breakpoint through the \eject penalty. As
a result this special output routine would be called
twice and the contents of \partial@page, i.e. the
material before the \multicols environment gets lost.
There are several solutions to avoid this problem,
but for now we will simply detect this and inform the
user that he/she has to enlarge the \premulticols by using a suitable value for the second argument.
\begin{check}\
\ifvoid\partial@page\else
\PackageError{multi@column@out}{Error saving partial page}
\fi
\end{check}

\ifvoid\partial@page\else
\PackageError{multi@column@out}{Error saving partial page}\fi

The next thing to do is to assign a new value to
\vsize. \LaTeX maintains the free room on the page
(i.e. the page height without the space for already
contributed floats) in the register \@colroom. We
must subtract the height of \partial@page to put
the actual free room into this variable.
\begin{output}{\multi@column@out}\
\global\let\kept@topmark\firstmark
\fi
\end{output}

Now we need to record the marks that are present
within the \partial@page so that we can construct
correct first and bottom marks later on. This is done
by the following code.

\prep@keptmarks

Finally we must reinsert all the footnotes which are already
present (i.e. those encountered when the material
saved in \partial@page was first processed). This
will reduce the free space (i.e. \pagetotal) by the

\footnotesize
\begin{footnotes}
8During such a call the \botmark gets globally copied to \topmark by the \TeX program.
\end{footnotes}
appropriate amount since we have changed the magnification factor, etc. above.

All the code above was only necessary for the unrestricted \texttt{multicol} version, i.e. the one that allows page breaks. If we are within a box there is no point in setting up special output routines or \texttt{\vsize}, etc.

But now we are coming to code that is necessary in all cases. We assign new values to \texttt{\vbadness}, \texttt{\hbadness} and \texttt{\tolerance} since it’s rather hard for \TeX to produce ‘good’ paragraphs within narrow columns.

Since nearly always the first pass will fail we ignore it completely telling \TeX to hyphenate directly. In fact, we now use another register to keep the value for the multicol pre-tolerance, so that a designer may allow to use \texttt{\pretolerance}.

For use with the new \TeX we set \texttt{\emergencystretch} to \texttt{\col@number \times 4pt}. However this is only a guess so at the moment this is done in a macro \texttt{\setemergencystretch} which gets the current \texttt{\vsize} and the number of columns as arguments. Therefore users are able to figure out their own formula.

Another hook to allow people adding their own extensions without making a new package is \texttt{\set@floatcmds} which handles any redefinitions of \TeX’s internal float commands to work with the \texttt{multicol} environment. At the moment it is only used to redefine \texttt{\@dblfloat} and \texttt{\end@dblfloat}.

Additionally, we advance \texttt{\baselineskip} by \texttt{\multicol@baselineskip} to allow corrections for narrow columns.

The \texttt{\hsize} of the columns is given by the formula:

\[
\texttt{\linewidth} - (\texttt{\col@number} - 1) \times \texttt{\columnsep} / \texttt{\col@number}
\]

The formula above has changed from release to release. We now start with the current value of \texttt{\linewidth} so that the column width is properly calculated when we are inside a minipage or a list or some other environment. This will be achieved with:

We also set \texttt{\linewidth} and \texttt{\columnwidth} to \texttt{\hsize}. In the past \texttt{\columnwidth} was left unchanged. This is inconsistent, but \texttt{\columnwidth} is used only by floats (which aren’t allowed in their current implementation) and by the \texttt{\footnote} macro. Since we want pagewide footnotes\footnote{I’m not sure that I really want pagewide footnotes. But balancing of the last page can only be achieved with this approach or with a multi-path algorithm which is complicated and slow. But it’s a challenge to everybody to prove me wrong! Another possibility is to reimplement a small part of the \texttt{fire_up} procedure in \TeX (the program). I think that this is the best solution if you are interested in complex page makeup, but it has the disadvantage that the resulting program cannot be called \TeX thereafter.} this simple trick saved us from rewriting the \texttt{\footnote} macros. However, some applications referred to \texttt{\columnwidth} as the “width of the current column” to typeset displays (the \texttt{amsmath} package, for example) and to allow the use of such applications together with \texttt{multicol} this is now changed.

Before we change \texttt{\linewidth} to the new value we record its old value in some register called \texttt{\full@width}. This value is used later on when we package all columns together.

This macro is used to set up the parameters associated with footnote floats. It can be redefined by applications that require different amount of spaces when typesetting footnotes.

Since we have to set \texttt{\col@number} columns on one page, each with a height of \texttt{\@colroom}, we have to assign \texttt{\vsize} = \texttt{\col@number \times \@colroom} in order to collect enough material before entering the \texttt{\output} routine again. In fact we have to add another \texttt{\col@number} to \texttt{\baselineskip - \topskip} if you think about it.

Since we have to set \texttt{\col@number} columns on one page, each with a height of \texttt{\@colroom}, we have to assign \texttt{\vsize} = \texttt{\col@number \times \@colroom} in order to collect enough material before entering the \texttt{\output} routine again. In fact we have to add another \texttt{\col@number} to \texttt{\baselineskip - \topskip} if you think about it.

\[
\texttt{\linewidth} - (\texttt{\col@number} - 1) \times \texttt{\columnsep} / \texttt{\col@number}
\]

\[
\texttt{\linewidth} - (\texttt{\col@number} - 1) \times \texttt{\columnsep} / \texttt{\col@number}
\]

\[
\texttt{\linewidth} - (\texttt{\col@number} - 1) \times \texttt{\columnsep} / \texttt{\col@number}
\]
But this might not be enough since we use \texttt{\textbackslash vsplit}
later to extract the columns from the gathered material. Therefore we add some ‘extra lines,’ the number depending on the value of the ‘\texttt{multicols}’ counter. The final value is assigned globally if \texttt{#1} is \texttt{global} because we want to use this macro later inside the output routine too.

\begin{verbatim}
\#1\advance\vsize
\footnotesize\vsize\tw@
\vsize\tw@
\footnotesize\vsize\tw@
\end{verbatim}

Here is the dimen register we need for saving away the outer value of \texttt{\@totalleftmargin}.

\begin{verbatim}
\newdimen\multicol@leftmargin
\end{verbatim}

When the end of the \texttt{multicols} environment is sensed we have to balance the gathered material. Depending on whether or not we are inside a boxed multicoll different things must happen. But first we end the current paragraph with a \texttt{\par} command.

\begin{verbatim}
\def\endmulticols{\par
\if\@inmulticols
In boxed mode we have to close the box in which we have gathered all material for the columns.

\begin{verbatim}
\global\let\kept@botmark\@empty
\global\let\kept@firstmark\@empty
\end{verbatim}

Now we call \texttt{\balance@columns} the routine that balances material stored in the box \texttt{\mult@box}.

\begin{verbatim}
\balance@columns
\end{verbatim}

After balancing the result has to be returned by the command \texttt{\page@sofar}. But before we do this we reinsert any marks found in box \texttt{\mult@box}.

\begin{verbatim}
\return@nonemptymark{first}\
\kept@firstmark
\return@nonemptymark{bot}\
\kept@botmark
\page@sofar
\global\let\kept@firstmark\@empty
\global\let\kept@botmark\@empty
\mult@info\tw@
(\texttt{\marktrace})
\mult@info\tw@
(\texttt{\marktrace})
\end{verbatim}

This finishes the code for the “boxed” case.

\begin{verbatim}
\else
\end{verbatim}

If we are in an unrestricted \texttt{multicols} environment we end the current paragraph with \texttt{\par} but this isn’t sufficient since \TeX’s \texttt{page\_builder} will not totally empty the contribution list.\footnote{This once caused a puzzling bug where some of the material was balanced twice, resulting in some overprints. The reason was the \texttt{\eject} which was placed at the end of the contribution list. Then the \texttt{page\_builder} was called (an explicit \texttt{\penalty} will empty the contribution list), but the line with the \texttt{\eject} didn’t fit onto the current page. It was then reconsidered after the output routine had ended, causing a second break after one line.} Therefore we must also add an explicit \texttt{\penalty}. Now the contribution list will be emptied and, if its material doesn’t all fit onto the current page then the output routine will be called before we change it. At this point we need to use \texttt{\penalty} not \texttt{\addpenalty} to ensure that a) the recent contributions are emptied and b) that the very last item on the main vertical list is a valid break point so that \TeX breaks the page in case it is overfull.

\begin{verbatim}
\penalty\z@
\end{verbatim}

Now it’s safe to change the output routine in order to balance the columns.

\begin{verbatim}
\output{\balance@columns@out}\eject
\if\@inmulticols
If the \texttt{multicols} environment body was completely empty or if a multi-page \texttt{multicols} just ends at a page boundary we have the unusual case that the \texttt{\eject} will have no effect (since the main vertical list is empty)—thus no output routine is called at all. As a result the material preceding the \texttt{multicols} (stored in \texttt{\partial@page}) will get lost if we don’t take of this by hand.

\begin{verbatim}
\if\@inmulticols
\unvbox\partial@page\fi
\end{verbatim}

After the output routine has acted we restore the kept marks to their initial value.

\begin{verbatim}
\global\let\kept@firstmark\@empty
\global\let\kept@botmark\@empty
(\texttt{\marktrace})
\mult@info\tw@
\{\texttt{Make kept marks empty}\}\
\end{verbatim}

The output routine above will take care of the \texttt{\vsizer} and reinsert the balanced columns, etc. But it can’t reinsert the \texttt{\footnotes} because we first have to restore the \texttt{\footins} parameter since we are returning to one column mode. This will be done in the next line of code; we simply close the group started in \texttt{\multicols}.

To fix an obscure bug which is the result of the current definition of the \texttt{\begin \end} macros, we check that we are still (logically speaking) in the \texttt{multicols} environment. If, for example, we forget to close some environment inside the \texttt{multicols} environment, the following \texttt{\endgroup} would be incorrectly
considered to be the closing of this environment.

Now it’s time to return any footnotes if we are in unrestricted mode:

We also set the ‘unbalance’ counter to its default. This is done globally since \TeX{} counters are always changed this way.\footnote{Actually, we are still in a group started by the \texttt{\begin} macro, so \texttt{\global} must be used anyway.}

We also take a look at the amount of free space on the current page to see if it’s time for a page break. The vertical space added thereafter will vanish if \texttt{\enough@room} starts a new page.

If statistics are required we finally report that we have finished everything.

Let us end this section by allocating all the registers used so far.

\begin{multicols}{2}
\section*{4.4 The output routines}

We first start with some simple macros. When typesetting the page we save the columns either in the box registers 0, 2, 4, . . . (locally) or 1, 3, 5, . . . (globally). This is \texttt{Plain \TeX{}} policy to avoid an overflow of the save stack.

Therefore we define a \texttt{\process@cols} macro to help us in using these registers in the output routines below. It has two arguments: the first one is a number; the second one is the processing information. It loops starting with \texttt{\count@=#1} (\texttt{\count@} is a scratch register defined in \texttt{Plain \TeX{}}), processes argument \texttt{#2}, adds two to \texttt{\count@}, processes argument \texttt{#2} again, etc. until \texttt{\count@} is higher than \texttt{\doublecol@number}. It might be easier to understand it through an example, so we define it now and explain its usage afterwards.

\begin{verbatim}
def\process@cols#1#2{
\count@#1\relax
\loop
⟨∗debug⟩
\typeout{Looking at box \the\count@}
⟨/debug⟩
#2%
\advance\count@tw@
\ifnum\count@<\doublecol@number
\repeat}
\end{verbatim}

We now define \texttt{\page@sofar} to give an example of the \texttt{\process@cols} macro. \texttt{\page@sofar} should output everything prepared by the balancing routine \texttt{\balance@columns}.

\begin{verbatim}
def\page@sofar{%
\balance@columns prepares its output in the even numbered scratch box registers. Now we output the columns gathered assuming that they are saved in the box registers 2 (left column), 4 (second column), . . . However, the last column (i.e. the right-
\end{verbatim}

\begin{verbatim}
def\page@sofar{%
\balance@columns prepares its output in the even numbered scratch box registers. Now we output the columns gathered assuming that they are saved in the box registers 2 (left column), 4 (second column), . . . However, the last column (i.e. the right-
\end{verbatim}
most) should be saved in box register 0.\footnote{You will see the reason for this numbering when we look at the output routines $\texttt{\textbackslash multi@column@out}$ and $\texttt{\textbackslash balance@columns@out}$.} First we ensure that the columns have equal width. We use $\texttt{\textbackslash process@cols}$ for this purpose, starting with \noindent $\texttt{\textbackslash count@0 = \textbackslash mult@rightbox}$. Therefore $\texttt{\textbackslash count@0}$ loops through $\texttt{\textbackslash mult@rightbox}$, $\texttt{\textbackslash mult@rightbox} + 2$, \ldots (to $\texttt{\textbackslash doublecol@number}$).

Before we tackle the bigger output routines we define just one more macro which will help us to find our way through the mysteries later. $\texttt{\textbackslash reinsert@footnotes}$ will do what its name indicates: it reinserts the footnotes present in $\texttt{\textbackslash footinbox}$ so that they will be reprocessed by TeX's $\texttt{\textbackslash page@builder}$. Instead of actually reinserting the footnotes we insert an empty footnote. This will trigger insertion mechanism as well and since the old footnotes are still in their box and we are on a fresh page $\texttt{\textbackslash skip@footins}$ should be correctly taken into account.

Now we can't postpone the difficulties any longer. The $\texttt{\textbackslash multi@column@out}$ routine will be called in two situations. Either the page is full (i.e. we have collected enough material to generate all the required columns) or a float or marginpar (or a $\texttt{\textbackslash clearpage}$ is sensed. In the latter case the $\texttt{\textbackslash outputpenalty}$ is less than $-10000$, otherwise the penalty which triggered the output routine is higher. Therefore it's easy to distinguish both cases: we simply test this register.

Now we put all columns together in an $\texttt{\textbackslash hbox}$ of width $\texttt{\textbackslash full@width}$ (shifting it by $\texttt{\textbackslash multicol@leftmargin}$ to the right so that it will be placed correctly if we are within a list environment) and separating the columns with a rule if desired.

As you will have noticed, we started with box register $\texttt{\textbackslash mult@firstbox}$ (i.e. the left column). So this time $\texttt{\textbackslash count@0}$ looped through 2, 4, \ldots (plus the appropriate offset). Finally we add box 0 and close the $\texttt{\textbackslash hbox}$.

The depths of the columns depend on their last lines. To ensure that we will always get a similar look as far as the rules are concerned we force the depth at least the depth of a letter ‘p’.

Before we tackle the bigger output routines we define just one more macro which will help us to find our way through the mysteries later. $\texttt{\textbackslash reinsert@footnotes}$ will do what its name indicates: it reinserts the footnotes present in $\texttt{\textbackslash footinbox}$ so that they will be reprocessed by TeX's $\texttt{\textbackslash page@builder}$. Instead of actually reinserting the footnotes we insert an empty footnote. This will trigger insertion mechanism as well and since the old footnotes are still in their box and we are on a fresh page $\texttt{\textbackslash skip@footins}$ should be correctly taken into account.

Now we can't postpone the difficulties any longer. The $\texttt{\textbackslash multi@column@out}$ routine will be called in two situations. Either the page is full (i.e. we have collected enough material to generate all the required columns) or a float or marginpar (or a $\texttt{\textbackslash clearpage}$ is sensed. In the latter case the $\texttt{\textbackslash outputpenalty}$ is less than $-10000$, otherwise the penalty which triggered the output routine is higher. Therefore it's easy to distinguish both cases: we simply test this register.

If this was a $\texttt{\textbackslash clearpage}$, a float or a marginpar we call $\texttt{\textbackslash speci@ls}$ otherwise we construct the final page. For the next block of code see comments in section 7.2.

Let us now consider the normal case. We have to $\texttt{\textbackslash vsplit}$ the columns from the accumulated material in box 255. Therefore we first assign appropriate values to $\texttt{\textbackslash split@topskip}$ and $\texttt{\textbackslash split@maxdepth}$. Then we calculate the current column height (in $\texttt{\dimen@0}$). Note that the height of $\texttt{\textbackslash partial@page}$ is already subtracted from $\texttt{\textbackslash colroom}$ so we can use its value as a starter.
But we must also subtract the space occupied by footnotes on the current page. Note that we first have to reset the skip register to its normal value. Again, the actual action is carried out in a utility macro, so that other applications can modify it.

\[314\]
\[
\text{divide}\\text{\restoreskip}\text{\footins}\text{\co@number}\]
\[
\text{\iffvoid\footins\else}\leave@mult@footins\fi\]

Now we are able to \texttt{\vsplit} off all but the last column. Recall that these columns should be saved in the box registers \texttt{2, 4,...} (plus offset).

\[318\]
\[
\text{\process@cols}\text{\mult@gfirstbox}{%}\]
\[
\text{\setbox}\text{\co@number}\]
\[
\text{\vsplit}\text{\@cclv}\text{\to}\text{\dimen@}\]

After splitting we update the kept marks.

\[321\]
\[
\text{\set@keptmarks}\]

If \texttt{\raggedcolumns} is in force we add a \texttt{vfill} at the bottom by unboxing the split box.

\[322\]
\[
\text{\iffshr@nking}\]
\[
\text{\setbox}\text{\co@number}\]
\[
\text{\vbox}\text{\to}\text{\dimen@}{\text{\unvbox}\text{\co@number}\text{\vfill}}\%
\]

Then the last column follows.

\[328\]
\[
\text{\setbox}\text{\mult@rightbox}\]
\[
\text{\vsplit}\text{\@cclv}\text{\to}\text{\dimen@}\]
\[
\text{\iffshr@nking}\]
\[
\text{\setbox}\text{\mult@rightbox}\]
\[
\text{\vbox}\text{\to}\text{\dimen@}{\text{\unvbox}\text{\mult@rightbox}\text{\vfill}}\%
\]

Having done this we hope that box \texttt{255} is emptied. If not, we reinsert its contents.

\[335\]
\[
\text{\iffvoid\@cclv\else}\]
\[
\text{\unvbox}\text{\@cclv}\text{\penalty}\text{\outputpenalty}\]

In this case a footnote that happens to fall into the leftover bit will be typeset on the wrong page. Therefore we warn the user if the current page contains footnotes. The older versions of \texttt{multicols} produced this warning regardless of whether or not footnotes were present, resulting in many unnecessary warnings.

\[338\]
\[
\text{\iffvoid\footins\else}\]
\[
\text{\PackageWarning{multicol}}\%
\]
\[
\text{\{I moved some lines to the next page.\MessageBreak Footnotes on page thepage\space might be wrong\}}\%
\]

\[344\]
\[
\fi\]

\[13\]This will produce a lot of overhead since both output routines are held in memory. The correct solution would be to redesign the whole output routine used in \LaTeX.\]
The macro \@makecol adds all floats assigned for the current page to this page. \@outputpage ships out the resulting box. Note that it is just possible that such floats are present even if we do not allow any inside a multicols environment.

\@makecol\@outputpage

After the page is shipped out we have to prepare the kept marks for the following page. \kept@firstmark and \kept@botmark reinitialized by setting them to \@empty. The value of \botmark is then assigned to \kept@topmark.

\global\let\kept@topmark\botmark
\global\let\kept@firstmark\@empty
\global\let\kept@botmark\@empty

⟨∗marktrace⟩\mult@info\tw@
{(Re)Init top mark:\MessageBreak
\meaning\kept@topmark
\@gobbletwo}⟨/
marktrace⟩

Now we reset \@colroom to \@colht which is \LaTeX's saved value of \textheight.

\global\@colroom\@colht

Then we process deferred floats waiting for their chance to be placed on the next page.

\process@deferreds
\@whilesw\if@fcolmade\fi{\@outputpage
\global\@colroom\@colht
\process@deferreds}\fi

If the user is interested in statistics we inform him about the amount of space reserved for floats.

\def\leave@mult@footins{\advance\dimen@-\skip\footins
\advance\dimen@-\ht\footins}

We left out two macros: \process@deferreds and \speci@ls.

\def\speci@ls{\ifnum\outputpenalty <-\@Mi
\PackageError{multicol}{Document end inside multicols environment}\@ehd
\@specialoutput\else
\fi}

\ifnum \outputpenalty<-\@MM
\PackageError{multicol}{Document end inside multicols environment}\@ehd
\else
\fi

For the next block of code see comments in section 7.2.

\mult@info\@ne{\Colroom:\MessageBreak\after float space removed = \the\Colroom \@gobble}\%

Having done all this we must prepare to tackle the next page. Therefore we assign a new value to \vsize. New, because \partial@page is now empty and \@colroom might be reduced by the space reserved for floats.

\set@mult@vsize \global

The \footins skip register will be adjusted when the output group is closed.

\fi

This macro is used to subtract the amount of space occupied by footnotes for the current space from the space available for the current column. The space current column is stored in \dimen@. See above for the description of the default action.

\PackageWarning{multicol}{Floats and marginpars not allowed inside 'multicols' environment!}
Additionally we empty the \@currlist to avoid later error messages when the \LaTeX output routine is again in force. But first we have to place the boxes back onto the \@freelist. (\@elts default is \relax so this is possible with \xdef.)

\xdef\@freelist{\@freelist\@currlist} %
\gdef\@currlist{} %
⟨∗colbreak⟩
\fi
⟨/colbreak⟩
\fi

If the penalty is \-10001 it will come from a \clearpage and we will execute \@doclearpage to get rid of any deferred floats.
\else \@doclearpage \fi
\}
\process@deferreds is a simplified version of \LaTeX's \@startpage. We first call the macro \@floatplacement to save the current user parameters in internal registers. Then we start a new group and save the \@deferlist temporarily in the macro \@tempb.
\def\process@deferreds{%
\@floatplacement
\@tryfcolumn\@deferlist
\if@fcolmade\else
\begingroup
\let\@tempb\@deferlist
Our next action is to (globally) empty \@deferlist and assign a new meaning to \@elt. Here \@scolelt is a macro that looks at the boxes in a list to decide whether they should be placed on the next page (i.e. on \@toplist or \@botlist) or should wait for further processing.
\gdef\@deferlist{}%
\let\@elt\@scolelt
Now we call \@tempb which has the form
\let\@elt(box register)\@elt(box register)...
So \@elt (i.e. \@scolelt) will distribute the boxes to the three lists.
\@tempb \endgroup
⟨∗colbreak⟩
\setbox\mult@box
⟨−colbreak⟩
\vbox{\unvbox\@cclv} %
For the next block of code see comments in section 7.2.
⟨∗colbreak⟩
\setbox\mult@box\vbox{%
\ifvoid\colbreak@box\else
\unvbox\colbreak@box\break
\mult@info@ne{Re-adding forced break(s) in balancing}%
\fi
\unvbox\@cclv} %
\balance@columns
This will bring us into the position to apply \page@sofar. But first we have to set \vsize to a value suitable for one column output.
\global\vsize\@colroom
\global\advance\vsize\ht\partial@page
Then we \unvbox the \partial@page (which may be void if we are not processing the first page of this \multicols environment.
\unvbox\partial@page
Then we return the first and bottom mark and the gathered material to the main vertical list.
\return@nonemptymark{first}\kept@firstmark
\return@nonemptymark{bot}\kept@botmark
\page@sofar
We need to add a penalty at this point which allows to break at this point since calling the output routine may have removed the only permissible break point thereby “glueing” any following skip to the balanced box. In case there are any weird settings for \multicolsep etc. this could produce funny results.
\penalty\z@
\}

As we already know, reinserting of footnotes will be done in the macro \endmulticols.
This macro now does the actual balancing.

We start by setting the kept marks by updating them with any marks from this box. This has to be done before we add a penalty of \(-10000\) to the top of the box, otherwise only an empty box will be considered.

\get@keptmarks\mult@box

We then continue by resetting trying to remove any discardable stuff at the end of \mult@box. This is rather experimental. We also add a forced break point at the very beginning, so that we can split the box to height zero later on, thereby adding a known \splittopskip glue at the beginning.

\setbox\mult@box\vbox{%
\penalty-\@M
\unvbox\mult@box
\remove@discardable@items%
}

Then follow values assignments to get the \vsplitting right. We use the natural part of \topskip as the natural part for \splittopskip and allow for a bit of undershoot and overshoot by adding some stretch and shrink.

\@tempdima\topskip
\splittopskip\@tempdima
\@plus\multicolundershoot
\@minus\multicolovershoot
\splitmaxdepth\maxdepth

The next step is a bit tricky: when \TeX assembles material in a box, the first line isn’t preceded by interline glue, i.e. there is no parameter like \boxtopskip in \TeX. This means that the baseline of the first line in our box is at some unpredictable point depending on the height of the largest character in this line. But of course we want all columns to align properly at the baselines of their first lines. For this reason we have opened \mult@box with a \penalty-10000. This will now allow us to split off from \mult@box a tiny bit (in fact nothing since the first possible break-point is the first item in the box). The result is that \splittopskip is inserted at the top of \mult@box which is exactly what we like to achieve.

\setbox\@tempboxa\vsplit\mult@box to\z@

Next we try to find a suitable starting point for the calculation of the column height. We should be less than the height finally chosen, but large enough to reach this final value in only a few iterations. The formula which is now implemented will try to start with the nearest value which is a multiple of \baselineskip. The coding is slightly tricky in \TeX and there are perhaps better ways...
We also allow for overfull boxes while we try to split the columns.
\vfuzz \col@number\baselineskip
The variable \last@try will hold the dimension used in the previous trial splitting. We initialize it with a negative value.
\last@try-p\loop
In order not to clutter up \TeX's valuable main memory with things that are no longer needed, we empty all globally used box registers. This is necessary if we return to this point after an unsuccessful trial. We use \process@cols for this purpose, starting with \mult@grightbox. Note the extra braces around this macro call. They are needed since Plain \TeX's \loop...\repeat mechanism cannot be nested on the same level of grouping.
\process@cols\mult@grightbox\global\setbox\count@\box\voidb@x\global\setbox\mult@grightbox\copy\mult@box
We start with the assumption that the trial will be successful. If we end up with a solution that is too bad we set \too@bad to true.
⟨∗badness⟩\global\too@badfalse⟨/badness⟩
Using \vspl it extract the other columns from box register \mult@grightbox. This leaves box register \mult@box untouched so that we can start over again if this trial was unsuccessful.
\process@cols\mult@firstbox\global\setbox\count@\vspl\mult@grightbox to\dimen0
After every split we check the badness of the resulting column, normally the amount of extra white in the column.
⟨∗badness⟩\ifnum\c@tracingmulticols>\@ne\message{\the\dimen0}\fi
\ifnum\badness>c@columnbadness\message(\too@bad)
\global\too@badtrue\fi
⟨/badness⟩
There is one subtle point here: while all other constructed boxes have a depth that is determined by \splitmaxdepth the last box will get a natural depth disregarding the original setting and the value of \splitmaxdepth or \boxmaxdepth. This means that we may end up with a very large depth in box \mult@grightbox which would make the result of the testing incorrect. So we change the value by unboxing the box into itself.
\boxmaxdepth\maxdepth\global\setbox\mult@grightbox\vbox{\unvbox\mult@grightbox}
We also save a copy \mult@firstbox at its “natural” size for later use.
\setbox\mult@nat@firstbox\vbox{\unvcopy\mult@firstbox}
After \process@cols has done its job we have the following situation:
\mult@rightbox ←− all material
\mult@gfirstbox ←− first column
\mult@gfirstbox + 2 ←− second column
... ...
\mult@grightbox ←− last column
We report the height of the first column, in brackets the natural size is given.
\ifnum\c@tracingmulticols>\@ne\message{\the\ht\mult@nat@firstbox}\fi
If \raggedcolumns is in force older releases of this file also shrunk the first column to its natural height at this point. This was done so that the first column doesn't run short compared to later columns but it is actually producing incorrect results (overprinting of text) in boundary cases, so since version v1.5q \raggedcolumns means allows for all columns to run slightly short.
Then we give information about the last column.\footnote{With \TeX{} version 3.141 it is now possible to use \LaTeX{}'s \texttt{\newlinechar} in the \texttt{\message} command, but people with older \TeX{} versions will now get \texttt{\newline} instead of a new line on the screen.}

\begin{verbatim}
   \message{\langle*debug\rangle}
   \ifnum\c@tracingmulticols>4
       \{\showoutput
         \batchmode
         \process@cols\one
         \{\showbox\count@\}\}
     \fi
   \langle/\debug\rangle
\end{verbatim}

We check whether our trial was successful. The test used is very simple: we merely compare the first and the last column. Thus the intermediate columns may be longer than the first if \texttt{\raggedcolumns} is used. If the right-most column is longer than the first then we start over with a larger value for \texttt{\dimen@}.

\begin{verbatim}
   \ifdim\ht\mult@grightbox >\dimen@
     \global\setbox\mult@grightbox
     \vbox to\dimen@
     \{\unvbox\mult@grightbox\}
     \ifnum\c@tracingmulticols>\one
       \message{final badness:}
     \fi
     \fi
\end{verbatim}

If the natural height of the first box is smaller than the current trial size but is larger than the previous trial size it is likely that we have missed a potentially better solution. (This could have happened if for some reason our first trial size was too high.) In that case we dismiss this trial and restart using the natural height for the next trial.

\begin{verbatim}
   \ifdim\ht\mult@nat@firstbox<\dimen@
     \ifdim\ht\mult@nat@firstbox>\last@try
       \too@badtrue
       \ifnum\c@tracingmulticols>\one
         \typeout{Retry: using natural height of first column!}
       \fi
     \fi
     \dimen@\ht\mult@nat@firstbox
     \last@try\dimen@
     \advance\dimen@-\p@
   \fi
\end{verbatim}

Thus if \texttt{\@tempboxa} is void we have a valid solution. In this case we take a closer look at the last column to decide if this column should be made as long as all other columns or if it should be allowed to be shorter. For this we first have to rebox the column into a box of the appropriate height. If tracing is enabled we then display the badness for this box.

\begin{verbatim}
   \global\setbox\mult@grightbox
   \vbox to\dimen@
   \{\unvbox\mult@grightbox\}
   \ifnum\c@tracingmulticols>\one
     \message{\langle*badness\rangle}
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{\langle*colbreak\rangle}
       \too@badtrue
       \ifnum\c@tracingmulticols>\one
         \typeout{forced break(s) in last column!}
       \fi
     \fi
   \fi
   \langle/\colbreak\rangle
\end{verbatim}

If \texttt{\@tempboxa} above was not void our trial was unsuccessful and we report this fact and try again.

\begin{verbatim}
   \global\setbox\mult@grightbox
   \vbox to\dimen@
   \{\unvbox\mult@grightbox\vfill\%
   \ifnum\c@tracingmulticols>\one
     \message{\langle*colbreak\rangle}
   \fi
\end{verbatim}

If the height of the last box is too large we mark this trial as unsuccessful.

\begin{verbatim}
   \too@badtrue
   \ifnum\c@tracingmulticols>\one
     \typeout{Rejected: last column too large!}
   \fi
   \else
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \fi
\end{verbatim}

To ensure that there isn’t a forced break in the last column we try to split off a box of size \texttt{\maxdimen} from \texttt{\mult@grightbox} (or rather from a copy of it). This should result in a void box after the split, unless there was a forced break somewhere within the column in which case the material after the break would have stayed in the box.

\begin{verbatim}
   \ifvoid\@tempboxa
     \setbox\@tempboxa
     \copy\mult@grightbox
     \setbox\z@\vsplit\@tempboxa to\maxdimen
     \ifvoid\@tempboxa
       \too@badtrue
       \ifnum\c@tracingmulticols>\one
         \typeout{Rejected: unprocessed forced break(s) in last column!}
       \fi
     \fi
   \else
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \fi
\end{verbatim}

\begin{verbatim}
   \global\setbox\mult@grightbox
   \vbox to\dimen@
   \{\unvbox\mult@grightbox\}
   \ifvoid\@tempboxa
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \else
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \fi
\end{verbatim}

\begin{verbatim}
   \global\setbox\mult@grightbox
   \vbox to\dimen@
   \{\unvbox\mult@grightbox\}
   \ifvoid\@tempboxa
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \else
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \fi
\end{verbatim}

\begin{verbatim}
   \global\setbox\mult@grightbox
   \vbox to\dimen@
   \{\unvbox\mult@grightbox\}
   \ifvoid\@tempboxa
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \else
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \fi
\end{verbatim}

\begin{verbatim}
   \global\setbox\mult@grightbox
   \vbox to\dimen@
   \{\unvbox\mult@grightbox\}
   \ifvoid\@tempboxa
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \else
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \fi
\end{verbatim}

\begin{verbatim}
   \global\setbox\mult@grightbox
   \vbox to\dimen@
   \{\unvbox\mult@grightbox\}
   \ifvoid\@tempboxa
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \else
     \too@badtrue
     \ifnum\c@tracingmulticols>\one
       \typeout{Rejected: unprocessed forced break(s) in last column!}
     \fi
   \fi
\end{verbatim}
Finally the switch `too@bad` is tested. If it was made true either earlier on or due to a rightmost column being too large we try again with a slightly larger value for `\dimen@`.

\begin{verbatim}
\iftoo@bad
⟨badness⟩
\advance\dimen@\p@
\repeat
\end{verbatim}

At that point `\dimen@` holds the height that was determined by the balancing loop. If that height for the columns turns out to be larger than the available space (which is `\@colroom`) we squeeze the columns into the space assuming that they will have enough shrinkability to allow this.\footnote{This might be wrong, since the shrinkability that accounts for the amount of material might be present only in some columns. But it is better to try then to give up directly.}

\begin{verbatim}
\ifdim\dimen@>\@colroom
\dimen@\@colroom
\fi
\end{verbatim}

Then we move the contents of the odd-numbered box registers to the even-numbered ones, shrinking them if requested. We have to use `\vbox` not `\vtop` (as it was done in the first versions) since otherwise the resulting boxes will have no height (\TeX{}book page 81). This would mean that extra `\topskip` is added when the boxes are returned to the page-builder via `\page@sofar`.\footnote{This might be wrong, since the shrinkability that accounts for the amount of material might be present only in some columns. But it is better to try then to give up directly.}

\begin{verbatim}
\ifdim\dimen@>\@colroom
\dimen@\@colroom
\fi
\end{verbatim}

\section*{4.5 The box allocations}

Early releases of these macros used the first box registers 0, 2, 4,\ldots for global boxes and 1, 3, 5,\ldots for the corresponding local boxes. (You might still find some traces of this setup in the documentation, sigh.) This produced a problem at the moment we had more than 5 columns because then officially allocated boxes were overwritten by the algorithm. The new release now uses private box registers.

\begin{verbatim}
\newbox\mult@rightbox
\newbox\mult@grightbox
\newbox\mult@gfirstbox
\newbox\mult@firstbox
\newbox\@tempa
\newbox\@tempa
\newbox\@tempa
\newbox\@tempa
\newbox\@tempa
\newbox\@tempa
\let\@tempa\relax
\end{verbatim}

\section*{5 New macros and hacks for version 1.2}

If we don't use \TeX{} 3.0 `\emergencystretch` is undefined so in this case we simply add it as an unused `<dimen>` register.

\begin{verbatim}
\newdimen\newdimen\newdimen\newdimen\newdimen\newdimen
\ifundefined{emergencystretch}
\newdimen\emergencystretch
\multiply\emergencystretch#1
\end{verbatim}

My tests showed that the following formula worked pretty well. Nevertheless the `\setemergencystretch` macro also gets `<hspace>` as second argument to enable the user to try different formulae.

\begin{verbatim}
\def\setemergencystretch#1#2{%
\emergencystretch 4pt
\multiply\emergencystretch#1%
\end{verbatim}

Even if this should be used as a hook we use a `\` in the name since it is more for experts.

\begin{verbatim}
\let\@dblfloat\@dbflt
\def\end@dblfloat{\par
\vskip\z@
\egroup
\color@endbox
\@largefloatcheck
\outer@nobreak
\end{verbatim}

This is cheap (defering the floats until after the current page) but any other solution would go deep into \LaTeX{}3's output routine and I don't like to work on it until I know which parts of the output routine have to be reimplemented anyway for \LaTeX{}3.
We have to add the float to the \texttt{@deferlist} because we assume that outside the \texttt{multicols} environment we are in one column mode. This is not entirely correct, I already used the \texttt{multicols} environment inside of \LaTeX's \texttt{twocolumn} declaration but it will do for most applications.

\section{Maintaining the mark registers}

This section contains the routines that set the marks so that they will be handled correctly. They have been introduced with version 1.4.

First thing we do is to reserve three macro names to hold the replacement text for \TeX{}'s primitives \texttt{\firstmark}, \texttt{\botmark} and \texttt{\topmark}. We initialize the first two to be empty and \texttt{\kept@topmark} to contain two empty pair of braces. This is necessary since \texttt{\kept@topmark} is supposed to contain the last mark from a preceding page and in \LaTeX{} any “real” mark must contain two parts representing left and right mark information.

\begin{verbatim}
\def\kept@topmark{{}{}
\let\kept@firstmark\@empty
\let\kept@botmark\@empty
\end{verbatim}

Sometimes we want to return the value of a “kept” mark into a \texttt{\mark} node on the main vertical list. This is done by the function \texttt{\return@nonemptymark}. As the name suggests it only acts if the replacement text of the kept mark is non-empty. This is done to avoid adding an empty mark when no mark was actually present. If we would nevertheless add such a mark it would be regarded as a valid \texttt{\firstmark} later on.

\begin{verbatim}
\def\return@nonemptymark#1#2{\ifx#2\@empty\else\mult@info\tw@
\the\kept@topmark
\meaning#2\%\nobreak\fi}
\end{verbatim}

For debugging purposes we take a look at the current dimensions of the box since in earlier versions of the code I made some mistakes in this area.

\begin{verbatim}
\langle∗debug\rangle
\typeout{Mark box #1 before:
ht \the\ht#1, dp \the\dp#1}\
\langle/\text{debug}\rangle
\end{verbatim}

Now we open a new group an locally copy the box to itself. As a result any operation, i.e. \texttt{\vsplit}, will only have a local effect. Without this trick the box content would get lost up to the level where the last assignment to the box register was done.

\begin{verbatim}
\begingroup\vbadness\@M
\setbox#1\copy#1\%
\setbox#1\vsplit#1\maxdimen\%
\end{verbatim}

Since the contents of the mark may be arbitrary \LaTeX{} code we better make sure that it doesn't get expanded any further. (Some expansion have been done already during the execution of \texttt{\markright} or \texttt{\markboth}.) We therefore use the usual mechanism of a toks register to prohibit expansion.

\begin{verbatim}
\toks\expandafter{#2}\%
\mark{\the\toks@}\%
\end{verbatim}

If we have some material in a box register we may want to get the first and the last mark out of this box. This can be done with \texttt{\get@keptmarks} which takes one argument: the box register number or its nick name defined by \texttt{\newbox}.

\begin{verbatim}
\def\get@keptmarks#1{\setbox#1\vsplit#1\maxdimen\%
\splitfirstmark\%
\splitbotmark\%
\end{verbatim}

Now we split the box to the maximal possible dimension. This should split off the full contents of the box so that effectively everything is split off. As a result \texttt{\splitfirstmark} and \texttt{\splitbotmark} will contain the first and last mark in the box respectively.

\begin{verbatim}
\setbox#1\vsplit#1\maxdimen\%
\end{verbatim}

Due to the current definition of \texttt{\markright} etc. it wouldn’t help to define the \texttt{\protect} command to prohibit expansion as any \texttt{\protect} has already vanished due to earlier expansions.
Therefore we can now set the kept marks which is a global operation and afterwards close the group. This will restore the original box contents.

\set@keptmarks\endgroup

For debugging we take again a look at the box dimension which shouldn't have changed.

\typeout{Mark box #1 after: \ht\the\ht#1, \dp\the\dp#1}\

The macro \set@keptmarks is responsible for setting \kept@firstmark and \kept@botmark, by checking the current values for \splitfirstmark and \splitbotmark.

\def\set@keptmarks{%
\ifx\kept@firstmark\@empty
We now put the contents of \splitfirstmark into \kept@firstmark. In the case that there wasn't any mark at all \kept@firstmark will not change by that operation.
\expandafter\def\expandafter\kept@firstmark\expandafter{\splitfirstmark}\
\fi}%

\def\prep@keptmarks{%
\if@boxedmulticols \else
\get@keptmarks\partial@page
\fi}

\def\remove@discardable@items{%
\edef\@tempa{s=\the\lastskip, p=\the\lastpenalty, k=\the\lastkern}\
\typeout\@tempa\
\unskip\unpenalty\unkern\
\edef\@tempa{s=\the\lastskip, p=\the\lastpenalty, k=\the\lastkern}\
\typeout\@tempa\
\unskip\unpenalty\unkern\
\edef\@tempa{s=\the\lastskip, p=\the\lastpenalty, k=\the\lastkern}\
\typeout\@tempa\
\unskip\unpenalty\unkern\
\edef\@tempa{s=\the\lastskip, p=\the\lastpenalty, k=\the\lastkern}\
\typeout\@tempa\
\unskip\unpenalty\unkern}\

\newif\too@bad
\newcount\c@columnbadness
\c@columnbadness=10000
\newcount\c@finalcolumnbadness
\c@finalcolumnbadness=9999

The \prep@keptmarks function is used to initialize the kept marks from the contents of \partial@page, i.e. the box that holds everything from the top of the current page prior to starting the multicols environment. However, such a box is only available if we are not producing a boxed multicols.

\def\prep@keptmarks{%
\ifboxedmulticols \else
\get@keptmarks\partial@page
\fi}
6 Fixing the \columnwidth

If we store the current column width in \columnwidth we have to redefine the internal \@footnotetext macro to use \textwidth for the width of the footnotes rather than using the original definition.

Starting with version v1.5r this is now done in a way that the original definition is still used, except that locally \columnwidth is set to \textwidth.

This solves two problems: first redefinitions of \@footnotetext done by a class will correctly survive and second if multicols is used inside a minipage environment the special definition of \@footnotetext in that environment will be picked up and not the one for the main galley (the latter would result in all footnotes getting lost in that case).

See the definition of the \multicols command further up for the exact code.

7 Further extensions

This section does contain code for extensions added to this package over time. Not all of them may be active, some might sit dormant and wait for being activated in some later release.

7.1 Not balancing the columns

This is fairly trivial to implement. we just have to disable the balancing output routine and replace it by the one that ships out the other pages.

The code for this environment was suggested by Matthias Clasen.

If we are not on the main galley, i.e., inside a box of some sort, that approach will not work since we don’t have a vertical size for the box so we better warn that we balance anyway.

When ending the environment we simply end the inner \multicols environment, except that we better also stick in some stretchable vertical glue so that the last column still containing text is not vertically stretched out.

7.2 Manual column breaking

The problem with manual page breaks within \multicols is the fact that during collection of material for all columns a page-forcing penalty (i.e. -10000 or higher) would stop the collecting pass which is not quite what is desired. On the other hand, using a penalty like -9999 would mean that there would be occasions where the \vsplitting operations within \multicols would ignore that penalty and still choose a different break point.

For this reason the current implementation uses a completely different approach. In a nutshell it extends the \LaTeX output routine handling by introducing an additional penalty flag (i.e., a penalty which is forcing but higher than -10000 so that the output routine can look at this value and thus knows why it has been called).

Inside the output routine we test for this value and if it appears we do two things: save the galley
up to this point in a special box for later use and reduce the \vsize by the height of the material seen. This way the forcing penalty is now hidden in that box and we can restart the collection process for the remaining columns. (This is done in \specs above.)

In the output routines that do the \vspl thing either for balancing or for a full page we simply combine box 255 with the saved box thus getting a single box for splitting which now contains forcing breaks in the right positions.

\columnbreak is modelled after \pagebreak except that we generate a penalty -10005.

\begin{verbatim}
\@Mv = 10005
\def\columnbreak{\ifnum\col@number<\tw@
  \PackageError{multicol}{\noexpand\columnbreak outside multicols}
  {This command can only be used within a multicols or multicols* environment.}
\else
  \ifvmode\penalty \@Mv\relax\else\@bsphack\vadjust{\penalty \@Mv\relax}\@esphack\fi\fi}
\end{verbatim}

Need a box to collect the galley up to the column break.

\begin{verbatim}
\newbox\colbreak@box
\columnbreak
\end{verbatim}
Index
